

### Supplementary Figure 1.

Gating strategy to differentiate CD4<sup>+</sup> T cell subsets in immunized mice.

Doublets were excluded using appropriate FSC-H/FSC-A gates, followed by gating on lymphocytes using appropriate SSC-A/FSC-A gates and CD4<sup>+</sup> T cells were selected as TCR $\beta$ <sup>+</sup> CD4<sup>+</sup> cells (a). Regulatory T cells were defined as CD4<sup>+</sup> T cells that were FoxP3<sup>+</sup> and proliferating Tregs were selected as Ki67<sup>+</sup> FoxP3<sup>+</sup> CD4<sup>+</sup> T cells (b). To select Tfh/Tfr cells, the CXCR5<sup>+</sup> PD-1<sup>+</sup> CD4<sup>+</sup> T cell population was separated into FoxP3<sup>+</sup> Tfr cells and FoxP3<sup>-</sup> Tfh cells (c). Proliferating Tfr cells were defined as Ki67<sup>+</sup> FoxP3<sup>+</sup> Tfr cells (d). FoxP3<sup>+</sup> Tfr cells were differentiated into CD25<sup>+</sup> and CD25<sup>-</sup> subsets and Bcl-6 expression was assessed on both populations (e). CXCR4 expression was assessed on both FoxP3<sup>+</sup> Tfr cells and FoxP3<sup>-</sup> Tfh cells (f). To identify T extrafollicular helper cell subsets PD-1<sup>high</sup> CD4<sup>+</sup> T cells were differentiated based upon their FoxP3 expression to gate on FoxP3<sup>-</sup> CXCR5<sup>-</sup> CXCR4<sup>+</sup> T extrafollicular helper cells and FoxP3<sup>+</sup> CXCR5<sup>-</sup> CXCR4<sup>+</sup> T extrafollicular regulatory cells (g). Data shown are from one mouse and are representative of five independent experiments.

### Supplementary Figure 2.

Representative FACS dot plots showing (a) IL-21R expression relative to CD25 expression on CD4+ T cells, representative FACS histogram overlays showing (b) the expression of IL-21R on CD44hi CD4+ T cells from *Il21r*<sup>-/-</sup> and WT mice and (c) CD25+ Tregs cells versus CD25+ Tfr cells. Data are representative of 2 experiments, where n=5.

### Supplementary Figure 3.

Gating strategy to select murine CD4<sup>+</sup> T cell populations after 3 days of *in vitro* culture.

Doublets were excluded using appropriate FSC-H/FSC-A gates, followed by gating on lymphocytes using appropriate SSC-A/FSC-A gates and CD4<sup>+</sup> T cells were identified as TCR $\beta$ <sup>+</sup> CD4<sup>+</sup> cells (a). CD4<sup>+</sup> T cells expressing high levels of were identified as CD25<sup>hi</sup> CD4<sup>+</sup> TCR $\beta$ <sup>+</sup> cells (b). The CD4<sup>+</sup> T cell population was divided into FoxP3<sup>+</sup> and FoxP3<sup>-</sup> populations, and CD25<sup>hi</sup> cells were identified in both populations (c). Data shown are from one mouse and are representative of two independent experiments.

#### Supplementary Figure 4.

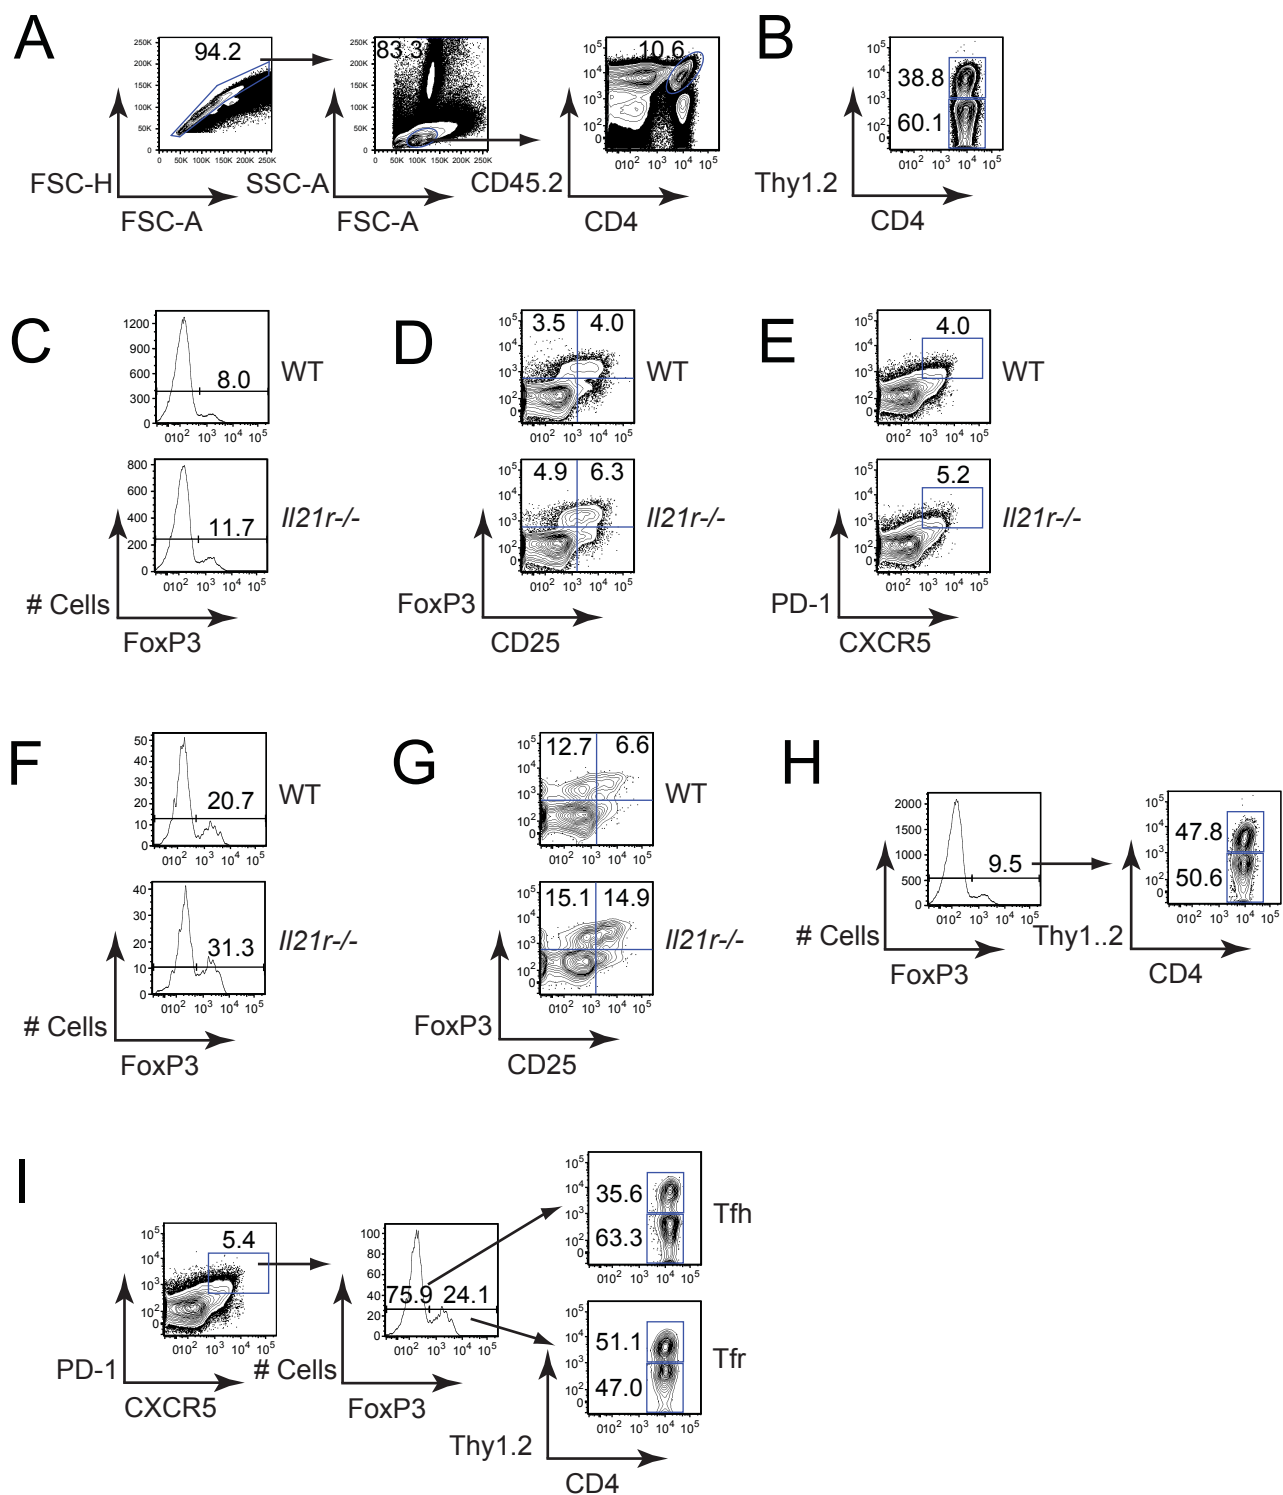

Gating strategy to differentiate human CD4<sup>+</sup> T cell subsets.

Doublets were excluded using appropriate FSC-H/FSC-A gates, followed by gating on lymphocytes using appropriate SSC-A/FSC-A gates and CD4<sup>+</sup> T cells were selected as CD3<sup>+</sup> CD4<sup>+</sup> cells (a). Regulatory T cells were defined either as CD4<sup>+</sup> T cells that were FoxP3<sup>+</sup> CD25<sup>+</sup> (b) or as CD4<sup>+</sup> T cells that were FoxP3<sup>+</sup> CD127<sup>low</sup> (c). To select Tfh/Tfr cells the CXCR5<sup>+</sup> PD-1<sup>+</sup> CD4<sup>+</sup> T cell population was differentiated into FoxP3<sup>+</sup> Tfr cells and FoxP3<sup>-</sup> Tfh cells (d). Data shown are from one patient and are representative of four independent experiments.

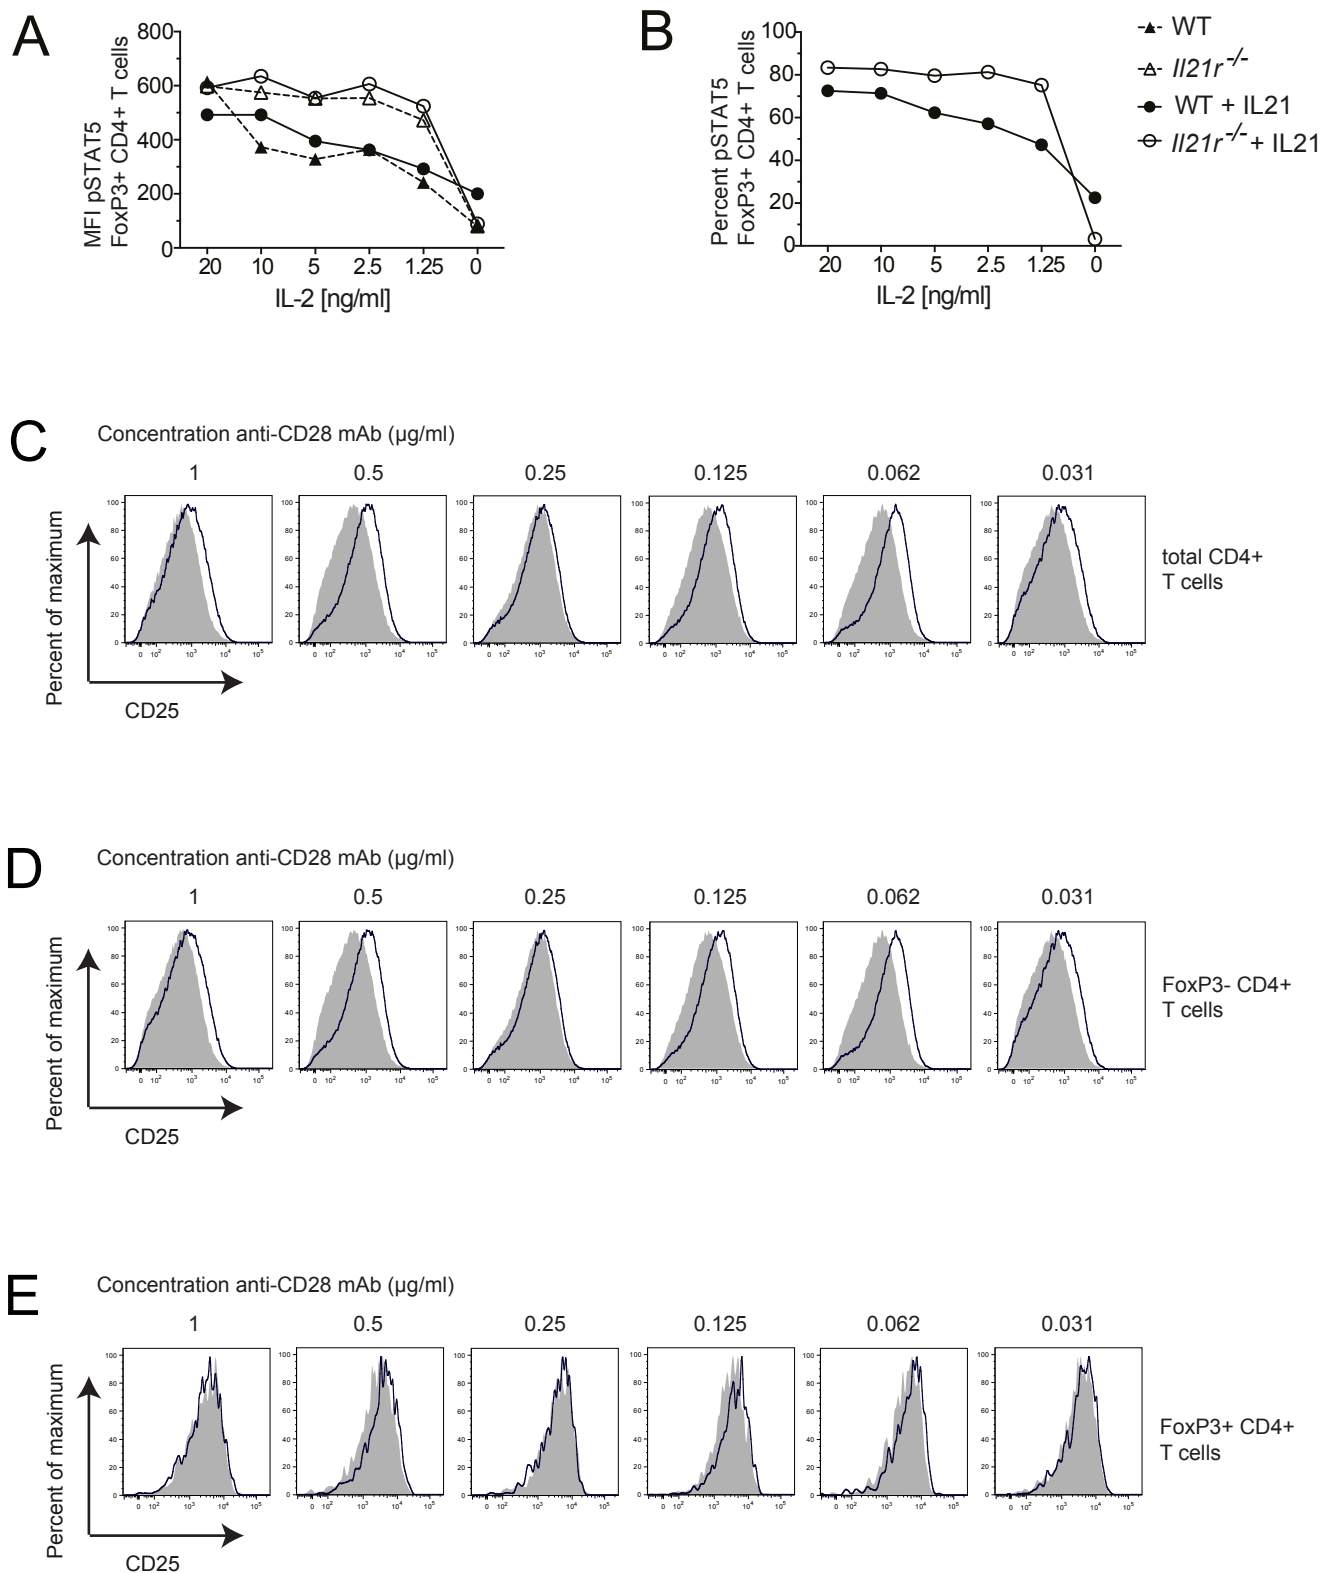

### Supplementary Figure 5.

Analyses of Germinal Centre B cells from Figure 3 showing (a) the percentage of CXCR4 expressing Germinal Centre B cells and (b) the mean fluorescence intensity (MFI) of CXCR4 expression on total B cells (c) the percentage of CXCR4 expressing Fas+GL7+ germinal center B cells and (d) the mean fluorescence intensity (MFI) of CXCR4 expression on Fas+GL7+ germinal center B cells.

### Supplementary Figure 6.

Gating strategy to differentiate Thy1.1<sup>+</sup> WT and Thy1.2<sup>+</sup> *Il21r*<sup>-/-</sup> donor CD45.2<sup>+</sup> CD4<sup>+</sup> T cell subsets in CD45.1<sup>+</sup> recipient mice. Doublets were excluded using appropriate FSC-H/FSC-A gates, followed by gating on lymphocytes using appropriate SSC-A/FSC-A gates and donor CD4<sup>+</sup> T cells were selected as CD45.2<sup>+</sup> CD4<sup>+</sup> cells (a). CD45.2<sup>+</sup> donor CD4<sup>+</sup> T cells were separated into Thy1.2<sup>-</sup> WT cells (Thy1.1<sup>+</sup>) and Thy1.2<sup>+</sup> *Il21r*<sup>-/-</sup> cells (b). Treg cells were identified by gating on FoxP3<sup>+</sup> Thy1.1<sup>+</sup> WT and Thy1.2<sup>+</sup> *Il21r*<sup>-/-</sup> CD4<sup>+</sup> T cells (c). FoxP3 expression on CD25<sup>+</sup> and CD25<sup>-</sup> Thy1.1<sup>+</sup> WT CD4<sup>+</sup> T cells and Thy1.2<sup>+</sup> *Il21r*<sup>-/-</sup> CD4<sup>+</sup> T cells was assessed (d). Follicular CD4<sup>+</sup> T cell subsets were selected by gating on CXCR5<sup>+</sup> PD-1<sup>+</sup> WT and *Il21r*<sup>-/-</sup> donor CD4<sup>+</sup> T cell subsets (e). Follicular CD4<sup>+</sup> T cells were separated into FoxP3<sup>+</sup> Tfr cells and FoxP3<sup>-</sup> Tfh cells in both WT and *Il21r*<sup>-/-</sup> donor CD4<sup>+</sup> T cell populations (f). FoxP3 expression on CD25<sup>+</sup> and CD25<sup>-</sup> follicular CD4<sup>+</sup> T cells in both WT and *Il21r*<sup>-/-</sup> donor populations was assessed (g). Donor regulatory T cells were identified by gating on FoxP3<sup>+</sup> CD45.2<sup>+</sup> donor CD4<sup>+</sup> T cells and were subsequently separated into Thy1.2<sup>-</sup> WT (Thy1.1<sup>+</sup>) cells and Thy1.2<sup>+</sup> *Il21r*<sup>-/-</sup> cells (h). Donor follicular cell populations were identified by gating on CXCR5<sup>+</sup> PD-1<sup>+</sup> CD45.2<sup>+</sup> donor CD4<sup>+</sup> T cells, which were then differentiated into FoxP3<sup>-</sup> Tfh cells and FoxP3<sup>+</sup> Tfr cells. Then the contribution of Thy1.2<sup>-</sup> WT (Thy1.1<sup>+</sup>) cells, and Thy1.2<sup>+</sup> *Il21r*<sup>-/-</sup> cells to these populations was assessed (i). Data shown are from one mouse and are representative of two independent experiments.

### Supplementary Figure 7.

Il21r<sup>-/-</sup> Tregs have increased STAT5 activation in response to IL-2. Splenocytes from Il21r<sup>-/-</sup> and WT mice were treated ex vivo for 15min with indicated concentrations of rmIL-2 +/- rmIL-21. Intracellular phosphorylated P-STAT5 expression within CD25<sup>+</sup>Foxp3<sup>+</sup>CD4<sup>+</sup>TCRb<sup>+</sup> T cells shown as (a) mean fluorescence intensity (MFI) P-STAT5 and (b) P-STAT5<sup>+</sup> cells as a percentage of CD25<sup>+</sup>FoxP<sup>+</sup>CD4<sup>+</sup>TCRb<sup>+</sup> T cells and is representative of two experiments with similar results.

CD4<sup>+</sup> T cells from the spleen of C57BL/6 mice were cultured ex vivo in the presence of anti-CD3 mAb and decreasing concentrations of anti-CD28 mAb, in the presence or absence of IL-21 neutralization (IL-21RFc) for 3 days. Representative FACS histogram overlays from Figure 6 showing the immunofluorescence intensity (MFI) of the expression of CD25 on (c) TCRb<sup>+</sup>CD4<sup>+</sup> T cells (d) Foxp3<sup>-</sup> TCRb<sup>+</sup>CD4<sup>+</sup> T cells and (e) Foxp3<sup>+</sup> TCRb<sup>+</sup>CD4<sup>+</sup> T cells in the absence (filled histograms) or presence (black lines) of 5 $\mu\text{g/ml}$  of IL-21RFc.

### Supplementary Figure 8.

Gating strategy to select Germinal Centre B cell populations in mice after immunization.

Doublets were excluded using appropriate FSC-H/FSC-A gates, followed by gating on lymphocytes using appropriate SSC-A/FSC-A gates and B cells were identified as CD19<sup>+</sup> lymphocytes (a). GC B cells were selected by gating on GL7<sup>+</sup> FAS<sup>+</sup> B cells (b). NP-specific GC B cells were selected by gating on NIP<sup>+</sup> GC B cells (c). IgG1 producing GC B cells were selected by gating on IgG1<sup>+</sup> FAS<sup>+</sup> GC B cells (d). NP-specific IgG1<sup>+</sup> producing GC B cells were selected by gating on NIP<sup>+</sup> FAS<sup>+</sup> IgG1<sup>+</sup> GC B cells (e). Data shown are from one mouse and are representative of two independent experiments.
