

Supplement Figure 1

Supplement Figure 1. IL-10R expression on main immune cell populations in lupus-prone NZB/W F1 mice.

Splenocytes from 14 weeks old healthy ($n = 3$ mice) and 28 weeks old NZB/W F1 animals with established autoantibodies and beginning nephritis (sick; $n = 2$ mice) were examined by flow cytometry for expression of IL-10R on CD4 and CD8 T cells, dendritic cells (DC), B cells (BC) and monocytic cells (MC). Depicted are MFI (left figure) and Δ MFI (right figure; calculated by subtracting the unstained MFI from the stained MFI).
