Supplementary figures

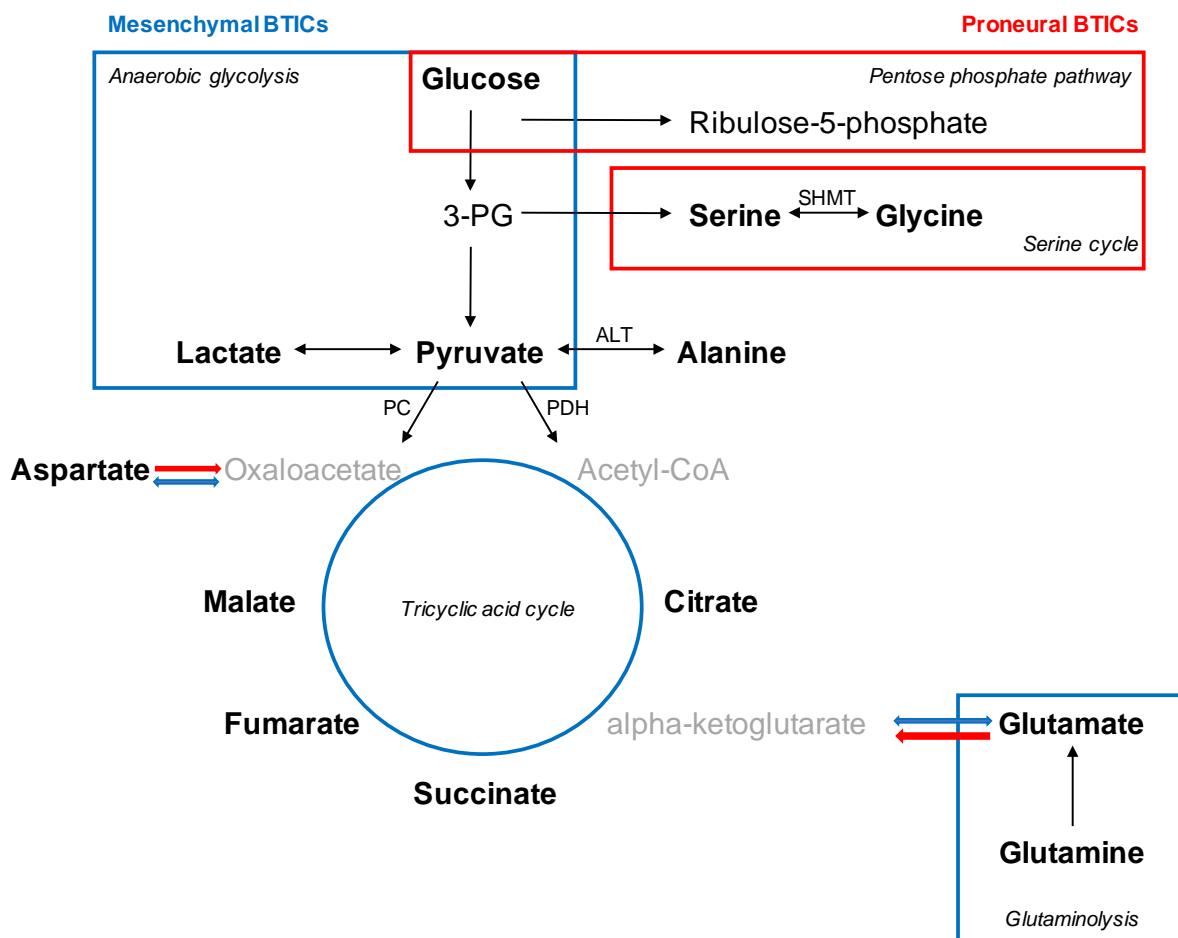

Supplementary Figure S1: Signaling in TC-11 and Western Blot quantification. Protein expression of (A) (p)mTOR, (B) (p)AMPK and (C) (p)STAT3 was explored after 48 h in TC-11. One representative Western Blot of TC-11 is depicted in (D). Western blots were repeated three times with at least two biological replicates and quantified using Image J, version 1.49. Asterisks indicate * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

Supplementary Figure S2: Western Blot analysis of autophagy and Caspase 3-dependent apoptosis in BTICs and TCs. Protein expression of LC3 I/II and cleaved caspase 3 of controls or cells treated with increasing doses of metformin as indicated was determined for (A) BTIC-11 (B) BTIC-18, (C) TC-11 and (D) TC-18. 1 μ M staurosporin was used as positive control for induction of caspase-dependent apoptosis. Western blots were repeated three times with at least two biological replicates and quantified using Image J for LC3 I/II in BTIC-11 (E), TC-11 (G), BTIC-18 (I) and TC-18 (K) or cleaved caspase 3 in BTIC-11 (F), TC-11 (H), BTIC-18 (J) and TC-18 (L). Asterisks indicate * $p < 0.05$, ** $p < 0.01$, **** $p < 0.0001$.

Supplementary Figure S3: (A) Live imaging of autophagosome formation was performed after transient transfection with an LC3-GFP-Plasmid over 48 h in TC-11. (B) Annexin/7-AAD FACS analysis showed increased apoptotic and necrotic cell death in glioma cells treated with staurosporine and metformin, which could be inhibited by treatment with the caspase-inhibitor ZVAD in glioma cells treated with staurosporine only but not in cells treated with metformin in addition.

Supplementary Figure S4: Summary of metabolic pathways observed in the investigated proneural and mesenchymal BTICs. 3-PG= 3-phosphoglycerate, SHMT= serine hydroxymethyltransferase, ALT= alanine aminotransferase, PC=pyruvate carboxylase, PDH=pyruvate dehydrogenase.
