

**Supplementary Figure S2: Patient flow.** Patient flow (left), number of excluded patients (center), and reasons for non-eligibility (right) for the CERTAIN study.

Patient records of 118 consecutive patients referred with a suspicion of central serous chorioretinopathy were screened for eligibility. Of those, 20 patients were excluded since the diagnosis of CSC could not be confirmed, while 7 were excluded since they did not undergo ultra-widefield indocyanine green angiography. Four eyes of 4 patients were excluded due to a suspected secondary choroidal neovascularization. In total, 178 eyes of 91 patients were included in the final analysis. CSC = central serous chorioretinopathy; CNV = choroidal neovascularization; UWF ICGA = ultra-widefield indocyanine green angiography.
